

A BitGraph gives bits **a place.**

When I hold this Polaroid in my hands, I am holding proof of an object that once existed in the exact location where it was recorded.

Digital files have never had that property.

What BitGraph does.

1

Fingerprint

Your file is hashed on your device.
The file itself never goes anywhere.

2

Place

The fingerprint fills a slot in a public
sequence, and holds that position
permanently.

3

Verify

Anyone can independently check
what existed and in what order.
Forever, without trusting us.

The place comes first.

1

Constrain

An **unpredictable** nonce establishes a unique position, **before** the artifact is known.

2

Bind

The file arrives and its SHA-256 fingerprint is bound to that position.

3

Consume

The position is **consumed** once. It cannot be moved, reused, or given to different bits.

The position exists **before the file arrives**.

Ordinary systems record a file, then assign it a position. BitGraph fixes the position first.

Who, when, and where are different facts.

A Polaroid has a physical place whether or not you know who took it or when. Signatures answer who. Timestamps bound when. Nothing gave a digital file a place. [BitGraph proves where.](#)

THEY PROVE

Who signed or authorized data

A digest existed **by a time**

Signed claims about provenance

BITGRAPH PROVES

Where these exact bits stand

The position existed **before the digest arrived**

The position was **consumed once and cannot be reassigned**

BitGraph complements signatures, timestamps, and C2PA by proving a fact they do not: [causal position](#).

Built. Running today.

Production infrastructure is **live**.

Public verifier. Portable proofs. Verification **never depends on our server**.

No account required. The file **never leaves the device**.

Daily key rotation and public wall-clock anchoring, by design.

Proofs are being created and **independently verified** now.

Who needs **a place** for bits.

First buyers: industries where disputed digital evidence costs real money.

Insurance claims	Photos and documents that must hold up when disputed
Inspections & field work	Condition evidence whose order and existence matter
AI outputs	Proof of exactly what a model produced, and in what order
Real-world data	Clinical and sensor records that must hold up under audit
Software & data releases	Buils, datasets, models, and other versioned artifacts

Mike, sole inventor of BitGraph.

Twenty years as a professional photographer taught me to think about time: moments happen once, in an order that cannot be replayed. Digital files are different. They copy perfectly, move freely, and carry no inherent place in that history. **BitGraph is my solution:** give the bits a place, and their order becomes something anyone can verify.

**I built the technology. Now I'm looking for
the right studio to help turn it into a company.**

Mike Argento · Buffalo, NY

Co-build the company on top of **the protocol**.

The protocol is built and running. Now I'm looking for the right studio to turn it into products for claims, inspections, and other high-trust workflows.

I bring the invention, IP, and product foundation.

You bring the team, go-to-market, and company-building machinery.
